

Construction

Features:

- Built using a mix of standard and custom staging pieces.
- Our manufacturing process utilizes CAD drawings and CNC routing technology to provide the highest quality staging products possible.
- Can be custom designed and built to exact dimensions & specifications.
- Can be built at a variety of fixed or adjustable heights to offer customers unlimited utilization of their stage products.
- When not in use in the pit, the decks can be re-purposed throughout the facility as rolling risers, small stages, camera platforms or stage extensions.
- Field measurements are performed with a Disto Meter which laser measures the pit filler area accurately to within 1/16" of an inch tolerance. This allows Staging Dimensions to build each piece of the orchestra pit filler to fit perfectly and line up with existing walls, frames and stages.
- Specification and engineering documentation, field measurement surveys, on-site training on installation and removal to ensure your custom pit filler or stage extension is the perfect fit.
